

PRACTICE PRICE LIST		SAR
<b>CONSULTATION</b>		
<b>Consultation Fee Dog- Cat</b>	150	Our standard consultation lasts 15 minutes, but we will always give you the time that you need with no increase in cost. The first time we see your pet for a problem, this fee covers the examination, diagnosis and treatment plan. Additional fees apply for add-on jobs like nail clips, further tests and drug treatments. We strongly advise an annual health check for your cat. To maintain protection against these infectious diseases a yearly booster vaccine is required. Regular examinations of your pet allow us to pick up problems at an early stage.
<b>Consultation Fee Small Animal-Bird</b>	100	
<b>Follow Up Cons Fee Dog- Cat</b>	75	If we see your pet for a follow-up consultation for the same problem, then a reduced consultation fee is applied. We strongly advise an annual health check for your pet.
<b>Follow Up Cons Fee Small Animal-Bird</b>	50	
<b>Kitten/Puppy Health Check</b>	100	We recommend an examination by a Veterinary Surgeon at the earliest opportunity after you have homed your new puppy. We would like you to know as soon as possible if there are any problems, and also to help you care for your new puppy. We advise regular free checks with our Veterinary Nurses while your puppy is growing. At 6 months of age we advise an examination with a Veterinary Surgeon to assess growth and development and plan any neutering surgery.
<b>Vaccinations</b>		
<b>Rabies Vaccination</b>	125	To maintain protection against these Rabies a yearly booster vaccine is required. Regular examinations of your cat allow us to pick up problems at an early stage
<b>Cat Vaccine 3 in 1</b>	150	
<b>Dog Vaccine DHPP</b>	150	
<b>Leukemia Vaccine</b>	175	
<b>Kitten/Puppy Vaccination Package</b>	400	The first puppy vaccination can be given from 6-8 weeks with the second injection 2-4 weeks later when the puppy is 10 weeks old or older. The quoted fee includes 2 examinations with a Veterinary Surgeon; 2 doses of the vaccine; the issue of a vaccine certificate and unlimited free advice on caring for your new dog!
<b>Cat/Dog annual booster Vaccine Package</b>	200	We strongly advise an annual health check for your pet. To maintain protection against these infectious diseases a yearly booster vaccine is required. Regular examinations of your Pet allow us to pick up problems at an early stage.
<b>Program anti-flea injection for cats - Dogs</b>	200	Program is a very safe and effective means of flea control. By giving your cat an injection we can prevent fleas from breeding in your house for 6 months! We also get to see you and your cat which gives us the best opportunity to monitor health. We will send you reminders to advise when the injections are due. Program is also available as a monthly oral product for cats and dogs.
<b>Rabbit combined annual vaccine</b>	140	Rabbits can be vaccinated from 5 weeks of age to protect against myxomatosis and viral hemorrhagic disease. The immunity lasts for a year and annual 'booster' vaccinations are needed to maintain protection.
<b>Deworming Vaccination</b>	50	for 1tablet per 10 kg body weight
<b>Antifungal Vaccine</b>	150	
<b>Ultrasonography</b>		
<b>Ultrasound (Pregnancy)</b>	300	Not includes preparation or Anesthesia prices if needed
<b>Ultrasound (Abdominal)</b>	550	
<b>Laboratory WORK</b>		

<b>Virus Strip Test</b>	150	CATS (FLV, FIV and Toxoplasma) DOGS (Parvo, Distemper, Giardia, CAV and CCV)
<b>OTHER</b>		
<b>Pet Passport Travel Package</b>	300	If you wish to travel abroad with your pet it is necessary to have a pet passport. The price quoted includes microchip implantation, rabies vaccination and the issue of the pet passport document. The passport is valid for travel 3 weeks after the first rabies vaccine.
<b>Pet Passport</b>	50	Booklet
<b>Microchip implantation</b>	150	We advise that all your pets are identified by microchip. Implantation is safe and the chip provides a reliable form of permanent identification of your pet. This will help many cases of pets reunited with their owners which would not have happened
<b>FILE opening</b>	50	
<b>Prescriptions</b>	50	We always aim to provide you with all the medications you need. If you wish to purchase Prescription Only Medication elsewhere you will need a prescription. To be consistent with our prescribing policy we will supply a prescription for the quoted fee to allow you to purchase a 6 week supply of a single drug. We do not currently give discounts for clients requiring multiple prescriptions as we do not give clients discounts for buying multiple drugs directly. The provision of a prescription is subject to an examination of your pet on a 3 monthly basis.
<b>Express Anal Glands</b>	50	WITHOUT SEDATION PRICES
<b>Nail Trim</b>	50	
<b>Ear Mites Cleaning /Ear Flushing</b>	75	Not include medication prices
<b>I.V. Catheter &amp; I.V. Fluid Therapy</b>	120	This simple procedure will establish direct I.V. access to make it an easy and smooth process for anesthesia along with having I.V. access at any time in case of a medical emergency. I.V. Fluids are a beneficial part of your pet's surgery to go along with anesthesia because it helps keep the pet's blood pressure regulated and correct during anesthesia. This also will keep the patient hydrated as well and correct any dehydration process during the procedure.
<b>Urinary Catheter / CAT</b>	150	Not includes Anesthesia prices if needed
<b>Urinary Catheter / DOG</b>	200	Not includes Anesthesia prices if needed
<b>Euthanasia</b>	200	Hopeless cases only
<b>SURGERY</b>		
<b>Male Dog Neutering Surgery</b>	500-1000	We castrate dogs from Chihuahuas to Great Danes and our costs vary accordingly. Your dog needs to be starved in the morning and will come home that evening.
<b>Female Dog Neutering Surgery</b>	900-1500	We spay bitches of all shapes and sizes and the cost varies accordingly. We continue to neuter bitches via a conventional mid-line laparotomy and ovariectomy, which we find safe, effective and comfortable for our patients. Your Veterinary Surgeon will discuss alternatives with you.
<b>Male Cat Neutering Surgery</b>	400-600	A routine procedure for us, if not for the cat. Your cat will come home in the evening and recovery is usually straightforward.
<b>Female Cat Neutering Surgery</b>	800-1000	We spay the girls early in the day and they recover quickly and are usually ready to go home in the evening. For your convenience you only have to come back for suture removal a week later.
<b>Male Rabbit Neutering Surgery</b>	400-500	Rabbits do not need to be starved prior to anesthesia. We give them a gaseous anesthesia with a tube in their windpipe. The anesthesia is very safe and recovery is swift. Your rabbit will come home in the evening and return for an early progress check after 1-2d and suture removal after a week.
<b>Female Rabbit Neutering Surgery</b>	600-800	Rabbits do not need to be starved prior to anesthesia. We give them a premed then a gas anesthesia with a tube in their windpipe or another device that maintains an airway. The anesthesia is very safe and recovery is swift. Your rabbit will come home in the evening with some pain relief for the first few days and return for an early progress check after 1-2d and suture removal after a week.
<b>C-Section CAT</b>	1000-2500	C-SECTION 1000 with spay – 1500 without spay After hours C-SECTION 2000 with spay – 2500 without spay (includes after hours fee)
<b>C-Section Dog</b>	1500-3500	C-SECTION 1500 with spay – 1800 without spay After hours C-SECTION 3000 with spay – 3500 without spay (includes after hours fee)

<b>Pyometra /CAT</b>	1500	Pyometra is a life threatening infection of the uterus. Having your pet spayed is the only effective treatment. If left untreated, the uterus can rupture and your pet will die. Early spaying is recommended to prevent this life threatening condition. Pyometra most commonly occurs within a few weeks of a pet being in heat.
<b>Pyometra /DOG</b>	3000	
<b>Wound Repair SMALL (less than 2 inches)</b>	300	Wounds have many causes, sizes, and locations. They are usually treated by cleaning, debriding (removal of damaged tissue), and closing/suturing the wound. A drain may be placed in a wound if there is concern for fluid build-up under the skin. Instructions for care will be sent home with you.
<b>Wound Repair MEDIUM (2 – 5 inches)</b>	500	
<b>Wound Repair LARGE (greater than 5 inches)</b>	700	
<b>Cherry Eye Repair</b>	950	Animals have 3 eyelids. The same two lids (upper and lower) that we have, and a third that crosses from the nose side. This third eyelid contains a gland that produces tears to keep the eye moist. When this gland becomes inflamed, it swells and has the appearance of a cherry sitting in the corner of the eye. A rare consequence of having a cherry eye repaired is a dry eye, because the gland that produces most of the tears has been damaged. This is extremely rare, but if it occurs, moisturizing drops will be needed long term.
<b>Dewclaw Removal</b>	950	Dewclaws are residual thumbs. The dewclaw nails do not make contact with the ground so tend to grow around and back into the paw if they are not kept trimmed. They can be found on either the front or rear paws, attached by bone or loosely hanging. Not all dogs have dewclaws. They are most often removed due to nail entrapment, infection, or if owners are unable to keep the nails trimmed.
<b>Hernia Repair UMBLICAL</b>	950	A hernia is caused by trapping of tissue between torn muscle and skin causing a pouch. They are most commonly located at the umbilicus (belly button area), inguinal area, perineal (next to the rectum), or in the diaphragm (the muscle between the chest and the abdomen) although they can occur anywhere there is muscle. They can be congenital (born with it) or traumatic (caused by trauma). All hernias are repaired by replacing the tissue back where it belongs and closing the hole in the muscle. We repair all hernias except diaphragmatic and perineal hernias.
<b>Hernia Repair INGUINAL</b>	1750	
<b>Exploratory Surgery</b>	3200	When we explore the abdomen, we look for unknown causes of your pet's illness and fix it if it is operable. We will have you leave a contact number for us so we can discuss our findings, options and prognosis based on what we find on exploration. An exploratory surgery is usually indicated when all other less invasive means of diagnosis have been exhausted.
<b>Foreign Body Removal</b>	3000	Animals often swallow things they should not. Often they pass undetected in the stool, but occasionally they get stuck along the way. Pet surgery is indicated to get it out if it will not pass on its own. We remove all varieties of things from pets. You will be provided with show and tell when you come to pick up your pet. We explore the entire abdomen to be sure that all foreign material from one end to the other is removed from your pet. Sadly, they usually do not learn their lesson and occasionally we have repeat offenders.
<b>Growth Removal SMALL (less than 1 inch)</b>	450	Growths can appear anywhere on your pet's body and can grow from many different cell types. Some are slow growing and some can grow quite quickly. Either way, any abnormal lump or bump should be checked by your veterinarian. A needle biopsy (a very small sample taken with a needle) can determine the type of growth and if removal is indicated. This will be done by your regular full service veterinarian. If a larger sample is needed, or you simply want the growth removed, we can remove the growth and send the entire piece of tissue to the lab with the results sent to your full service veterinarian for review and follow up care. If the cell type is unknown prior to surgery or if the growth is suspicious for cancer, we will make every effort to achieve clean margins of skin around the growth. Therefore, the incision will appear larger than the actual growth was. There are some areas of the body where the skin will not allow for clean margins and only a debulking of the mass can be achieved. If the growth was deemed benign prior to surgery, removing this extra margin of skin will not be necessary. Drainage tubes and bandages may be used post-op depending on the location and size of the growth. Instructions for care will be sent home with you.
<b>Growth Removal MEDIUM (1 – 3 inches)</b>	1200	
<b>Growth Removal LARGE (3 – 5 inches)</b>	1900	
<b>Growth Removal EXTRA LARGE (greater than 5 inches)</b>	2700	
<b>Enucleation (for 1 eye ball)</b>	1100	Enucleation is removal of the eye ball. There are many reasons that the eye ball needs removal. Trauma, glaucoma, and cancer are the 3 most common reasons. When the eye is removed, the lids are closed and sealed. Hair will regrow over the area and the skin will lie flat. Pets compensate well with only one eye.
<b>Entropion</b>	700	Entropion is a rolling in of the eyelids leading the lashes to rub on the eyeball. This can cause minor irritation up to severe corneal ulcerations. The number of affected lids depends on your pet's anatomy. A minor nip-tuck of the eyelid will allow the lid to unroll and relieve the irritation to the eye. It is best to slightly overcorrect the lid so that any future irritation will not allow the lid to roll back in. You may see a bit of pink in your pet's eye once the lids are corrected. This is simply the conjunctiva around your pet's eye. Sometimes visibility of the pink area will subside as the swelling goes down, other times you may continue to see the pink area. This is cosmetic only and will not negatively affect your pet. The fee for correction is per lid, not per eye. One to four lids can be affected. ENTROPION – 700SAR (Folding in/out of Eyelids, per eyelid)
<b>Simple Fracture repair</b>	800	

\*Drug price is not included in this price list.
